Contents of this lesson

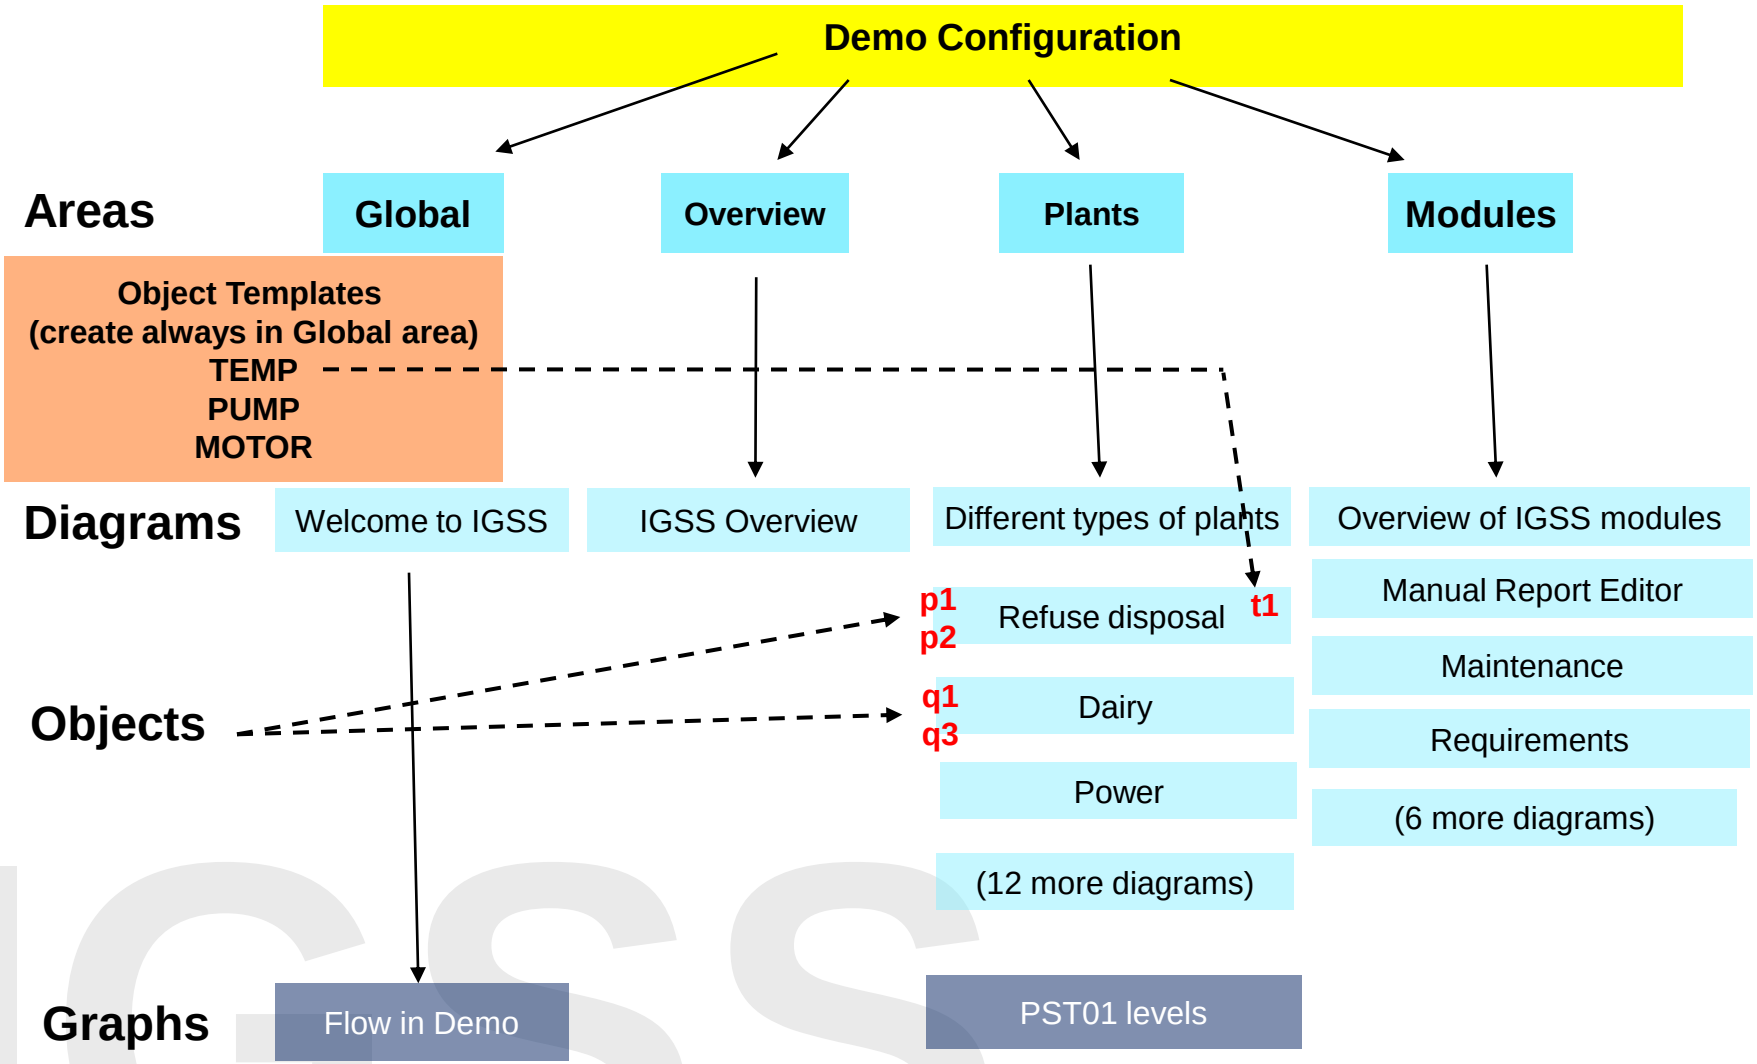

Topics:

- What is a configuration?
- What is an object?
- What is an atom?
- What is a decriptor?

What is a configuration ?

What is an object in IGSS ?

- An object is typically a process component for instance a pump, a valve, etc.

- An object in IGSS consists of two elements
  - The invisible properties (scan interval, logging, etc.)
  - The visible properties – how is the object shown

- All properties are presented in one dialog box

- A way to determine the size of the IGSS system
  - The more objects, the larger the process
  - The customer buys a number of objects

Object types in IGSS

Non-process objects = Container objects

Area → Divides an IGSS configuration into logical parts.
A collection of diagrams, graphs and objects.

Diagram → The individual mimic diagrams in the configuration.

Graph → Process states and values in the form of curves.

Group → A collection of objects and descriptors to be treated as one entity. Used for copy/paste and export/import.

Process objects = Process components

Analog
Table
Counter
Digital
String
Scaling

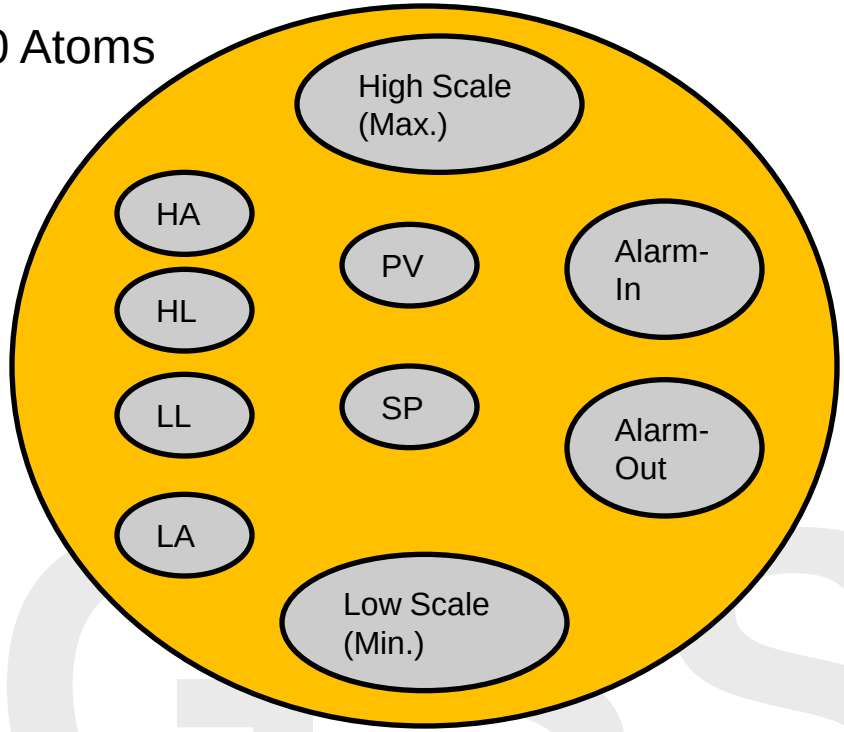

Objects and atoms

An atom in IGSS corresponds to a tag or an I/O point in other SCADA systems

Analog object

Object = q1 – Flow meter

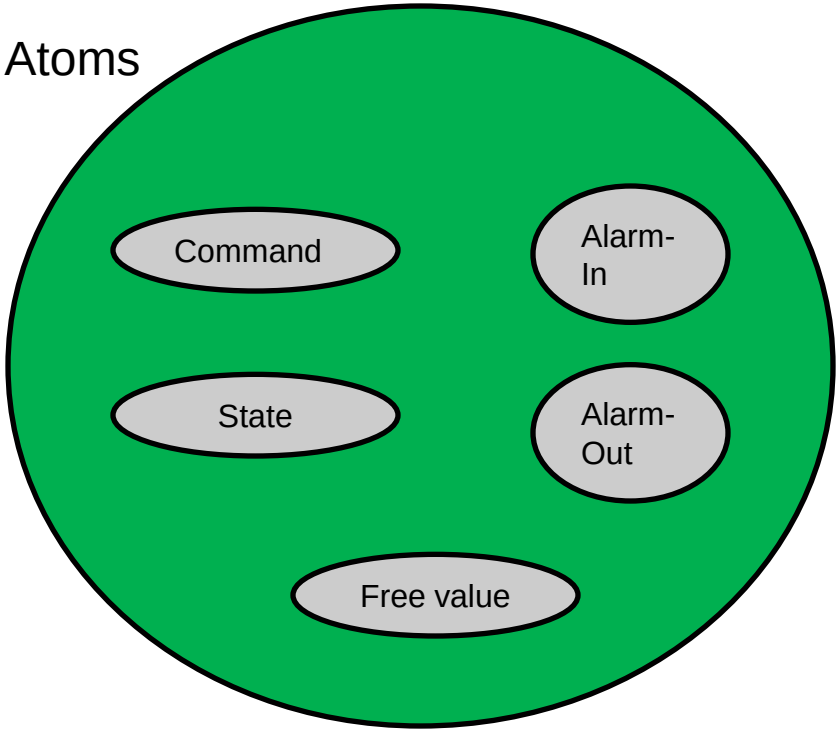

10 Atoms

Digital object

P1 – Pump water out

5 Atoms

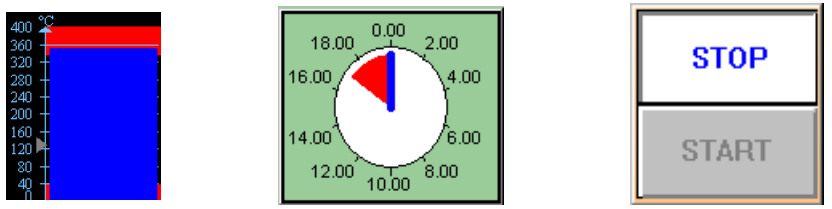

What is a descriptor ?

A descriptor is a graphical representation of a process component.
You can refer to the same object many times with different descriptors.
